IEEE 802.5 MIB using SMIV2

Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

1. Introduction

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects used for managing subnetworks which use the IEEE 802.5 Token Ring technology described in 802.5 Token Ring Access Method and Physical Layer Specifications, IEEE Standard 802.5-1989 [7]. This memo is a replacement for RFC 1231.

2. The SNMPv2 Network Management Framework

The SNMPv2 Network Management Framework consists of four major components. They are:

- o RFC 1442 [1] which defines the SMI, the mechanisms used for describing and naming objects for the purpose of management.
- o STD 17, RFC 1213 [2] defines MIB-II, the core set of managed objects for the Internet suite of protocols.
- o RFC 1445 [3] which defines the administrative and other architectural aspects of the framework.
- o RFC 1448 [4] which defines the protocol used for network access to managed objects.

The Framework permits new objects to be defined for the purpose of experimentation and evaluation.

2.1. Object Definitions

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the subset of Abstract Syntax Notation One (ASN.1) defined in the SMI. In particular, each object type is named by an OBJECT IDENTIFIER, an administratively assigned name. The object type together with an object instance serves to uniquely identify a specific instantiation of the object. For human convenience, we often use a textual string, termed the descriptor, to refer to the object type.

3. Overview

This memo defines three tables: the 802.5 Interface Table, which contains state and parameter information which is specific to 802.5 interfaces, the 802.5 Statistics Table, which contains 802.5 interface statistics, and the 802.5 Timer Table, which contains the values of 802.5-defined timers. A managed system will have one entry in the 802.5 Interface Table and one entry in the 802.5 Statistics Table for each of its 802.5 interfaces. The 802.5 Timer Table is obsolete, but its definition has been retained in this memo for backward compatibility.

This memo also defines OBJECT IDENTIFIERS, some to identify interface tests for use with the ifTestTable [6], and some to identify Token Ring interface Chip Sets.

3.1. MAC Addresses

All representations of MAC addresses in this MIB Module use the MacAddress textual convention [5] for which the address is in the "canonical" order defined by IEEE 802.1a, i.e., as if it were transmitted least significant bit first, even though 802.5 requires MAC addresses to be transmitted most significant bit first.

16-bit addresses, if needed, are represented by setting their upper 4 octets to all zeros, i.e., AAFF would be represented as 00000000AAFF.

3.2. Relationship to RFC 1213

When this MIB module is used in conjunction with the "old" (i.e., pre-RFC 1573) interfaces group, the relationship between an 802.5 interface and an interface in the context of the RFC 1213 is one-to-one. That is, the value of an ifIndex object instance for an 802.5 interface can be directly used to identify corresponding instances of the objects defined in this memo.

3.3. Relationship to RFC 1573

RFC 1573, the Interface MIB Evolution, requires that any MIB module which is an adjunct of the Interface MIB, clarify specific areas within the Interface MIB. These areas were intentionally left vague in RFC 1573 to avoid over constraining the MIB module, thereby precluding management of certain media-types.

Section 3.3 of RFC 1573 enumerates several areas which a media-specific MIB module must clarify. Each of these areas is addressed in a following subsection. The implementor is referred to RFC 1573 in order to understand the general intent of these areas.

3.3.1. Layering Model

For the typical usage of this IEEE 802.5 MIB module, there will be no sub-layers "above" or "below" the 802.5 interface. However, this MIB module does not preclude such layering.

3.3.2. Virtual Circuits

802.5 does not support virtual circuits.

3.3.3. ifTestTable

This MIB module defines two tests for 802.5 interfaces: Insertion and Loopback. Implementation of these tests is not required.

3.3.4. ifRcvAddressTable

The ifRcvAddressTable is defined to contains all MAC addresses, unicast, multicast (group) and broadcast, for which an interface will receive packets. For 802.5 interfaces, its use includes functional addresses. The format of the address, contained in ifRcvAddressAddress, is the same as for ifPhysAddress.

For functional addresses on a particular 802.5 interface, only one ifRcvAddressTable entry is required. That entry is the one for the address which has the functional address bit ANDed with the bit mask of all functional addresses for which the interface will accept frames.

3.3.5. ifPhysAddress

For an 802.5 interface, ifPhysAddress contains the interface's IEEE MAC address, stored as an octet string of length 6, in IEEE 802.1a "canonical" order, i.e., the Group Bit is positioned as the low-order bit (0x01) of the first octet.

3.3.6. ifType

The objects defined in this memo apply to each interface for which the ifType has the value:

iso88025-tokenRing(9)

```

```

dot5IfIndex      OBJECT-TYPE
  SYNTAX         Integer32
  MAX-ACCESS     read-only
  STATUS         current
  DESCRIPTION
    "The value of this object identifies the
    802.5 interface for which this entry
    contains management information.  The
    value of this object for a particular
    interface has the same value as the
    ifIndex object, defined in MIB-II for
    the same interface."
 ::= { dot5Entry 1 }

dot5Commands     OBJECT-TYPE
  SYNTAX         INTEGER {
                    noop(1),
                    open(2),
                    reset(3),
                    close(4)
                  }
  MAX-ACCESS     read-write
  STATUS         current
  DESCRIPTION
    "When this object is set to the value of
    open(2), the station should go into the
    open state.  The progress and success of
    the open is given by the values of the
    objects dot5RingState and
    dot5RingOpenStatus.
      When this object is set to the value
    of reset(3), then the station should do
    a reset.  On a reset, all MIB counters
    should retain their values, if possible.
    Other side affects are dependent on the
    hardware chip set.
      When this object is set to the value
    of close(4), the station should go into
    the stopped state by removing itself
    from the ring.
      Setting this object to a value of
    noop(1) has no effect.
      When read, this object always has a
    value of noop(1).
      The open(2) and close(4) values
    correspond to the up(1) and down(2) values
    of MIB-II's ifAdminStatus and ifOperStatus,
    i.e., the setting of ifAdminStatus and

```

dot5Commands affects the values of both
dot5Commands and ifOperStatus."

::= { dot5Entry 2 }

dot5RingStatus OBJECT-TYPE

SYNTAX INTEGER (0..262143)

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The current interface status which can be used to diagnose fluctuating problems that can occur on token rings, after a station has successfully been added to the ring.

Before an open is completed, this object has the value for the 'no status' condition. The dot5RingState and dot5RingOpenStatus objects provide for debugging problems when the station can not even enter the ring.

The object's value is a sum of values, one for each currently applicable condition. The following values are defined for various conditions:

0 = No Problems detected
32 = Ring Recovery
64 = Single Station
256 = Remove Received
512 = reserved
1024 = Auto-Removal Error
2048 = Lobe Wire Fault
4096 = Transmit Beacon
8192 = Soft Error
16384 = Hard Error
32768 = Signal Loss
131072 = no status, open not completed."

    SYNTAX      Integer32
    MAX-ACCESS  read-only
    STATUS      obsolete
    DESCRIPTION
        "The value of this object identifies the
        802.5 interface for which this entry
        contains timer values. The value of
```

this object for a particular interface has the same value as MIB-II's ifIndex object for the same interface."

::= { dot5TimerEntry 1 }

dot5TimerReturnRepeat OBJECT-TYPE

SYNTAX Integer32

MAX-ACCESS read-only

STATUS obsolete

DESCRIPTION

"The time-out value used to ensure the interface will return to Repeat State, in units of 100 micro-seconds. The value should be greater than the maximum ring latency."

::= { dot5TimerEntry 2 }

dot5TimerHolding OBJECT-TYPE

SYNTAX Integer32

MAX-ACCESS read-only

STATUS obsolete

DESCRIPTION

"Maximum period of time a station is permitted to transmit frames after capturing a token, in units of 100 micro-seconds."

::= { dot5TimerEntry 3 }

dot5TimerQueuePDU OBJECT-TYPE

SYNTAX Integer32

MAX-ACCESS read-only

STATUS obsolete

DESCRIPTION

"The time-out value for enqueueing of an SMP PDU after reception of an AMP or SMP frame in which the A and C bits were equal to 0, in units of 100 micro-seconds."

::= { dot5TimerEntry 4 }

dot5TimerValidTransmit OBJECT-TYPE

SYNTAX Integer32

MAX-ACCESS read-only

STATUS obsolete

DESCRIPTION

"The time-out value used by the active monitor to detect the absence of valid transmissions, in units of 100 micro-seconds."

```
::= { dot5TimerEntry 5 }
```

```
dot5TimerNoToken OBJECT-TYPE
```

```
SYNTAX Integer32
```

```
MAX-ACCESS read-only
```

```
STATUS obsolete
```

```
DESCRIPTION
```

```
"The time-out value used to recover from
various-related error situations.
If N is the maximum number of stations on
the ring, the value of this timer is
normally:
dot5TimerReturnRepeat + N*dot5TimerHolding."
```

```

--          802.5 Interface Tests

dot5Tests OBJECT IDENTIFIER ::= { dot5 3 }

-- RFC 1573 defines the ifTestTable, through which a
-- network manager can instruct an agent to test an interface
-- for various faults. A test to be performed is identified
-- as an OBJECT IDENTIFIER.

-- The Insert Function test

dot5TestInsertFunc OBJECT-IDENTITY
    STATUS      current
    DESCRIPTION
        "Invoking this test causes the station to test the insert
        ring logic of the hardware if the station's lobe media
        cable is connected to a wiring concentrator. Note that
        this command inserts the station into the network, and
        thus, could cause problems if the station is connected
        to a operational network."
    ::= { dot5Tests 1 }

```

-- The Full-Duplex Loop Back test

```
dot5TestFullDuplexLoopBack OBJECT-IDENTITY
  STATUS      current
  DESCRIPTION
    "Invoking this test on a 802.5 interface causes the
    interface to check the path from memory through the
    chip set's internal logic and back to memory, thus
    checking the proper functioning of the system's
    interface to the chip set."
 ::= { dot5Tests 2 }
```

-- 802.5 Hardware Chip Sets

-- RFC 1229 specified an object, ifExtnsChipSet, with the
-- syntax of OBJECT IDENTIFIER, to identify the hardware
-- chip set in use by an interface. RFC 1573 obsoletes
-- the use of ifExtnsChipSet. However, the following
-- definitions are retained for backwards compatibility.

```
dot5ChipSets OBJECT IDENTIFIER ::= { dot5 4 }

APPENDIX A - Changes from RFC 1231

This memo has the following differences from RFC 1231:

- (1) This memo is formatted using the SNMPv2 SMI.
- (2) The relationship of the "open" and "close" states of dot5Commands to the value of ifAdminStatus has been clarified. In particular, the setting of one affects the value of the other.
- (3) The relationship dot5RingSpeed and ifSpeed has been clarified. In particular, ifSpeed indicates the current ring-speed; dot5RingSpeed indicates the ring-speed at the next insertion into the ring. If the interface doesn't support changing ring-speed, then dot5RingSpeed can only be set to its current value. When dot5RingSpeed has the value 'unknown(1)', the ring-speed is to be set to the ring's actual ring-speed.
- (4) Write-access to dot5ActMonParticipate is not required, and a change to the value of dot5ActMonParticipate does not take effect until the next Active Monitor election.
- (5) Write-access to dot5Functional is not required.
- (6) A new object, dot5LastBeaconSent has been defined to contain the timestamp of the last beacon frame sent.
- (7) The dot5TimerTable has been designated as obsolete.
- (8) Text has been added describing the applicability of RFC 1573 [6] to 802.5 interfaces.
- (9) Other minor editorial changes.

Security Considerations

Security issues are not discussed in this memo.
